

FRANKSTON CITY JOURNEY TO WORK

Understanding where workers come from is important information for Local Government. It assists in planning and advocacy for roads and public transport provision. It also helps to clarify the economic and employment drivers across areas and assists in understanding the degree of employment self containment within a local government area. This data is a part of the 'journey to work' data set.

The journey to work data that is presented below is based on the 2001 Census Question: "For the main job held last week, what was the person's workplace address?"

This data is then cross-tabulated with the person's current usual residential address to create a matrix of home to work, with the focus of the analysis on the work destination. This information is generally not available at the small area (suburb / locality) level due to geographic limitations when being coded or processed.

Where do the workers come from?
